

Soft Reline on Dentures

What is the soft lining in my dentures?

The soft lining is a specially compounded dental plastic. This plastic is designed to make your dentures more comfortable and efficient despite the tissue irregularities.

How long will the lining remain soft?

Most patients find that this cushion will remain soft and comfortable for months. How long it will remain soft depends on many factors, some of which are not clearly understood. Your new lining is made of the most satisfactory material presently available.

How should I clean my soft lining?

Clean your soft lining with wet cotton and cold tap water. A rough abrasive or brush will cause you to scar the lining or even separate it from the denture. If possible, rinse your denture in cold water after meals. Clean the ridged portion of the denture in your usual manner.

Note: effervescent cleaning is not recommended
