

Laser Early Cavity Diagnosis...

More and more patients place value on healthy and attractive teeth. In order to maintain them, the earliest possible care is essential. DIAGNOdent helps you with early detection. Even very small lesions are detected at the earliest stage, enabling you to protect and preserve the tooth substance.

The Kavo DiagnoDent is a laser device which enables us to detect the presence of dental decay in its earliest stage.

In the past, we used a sharp probe to detect cavities. The cavity had to be larger

than the size of the tip of the explorer before we could detect it. This did not always accurately reflect the depth of tooth decay. We need a better and more sensitive device to detect tooth decay. The DiagnoDent emits a laser beam to the tooth. If there is dental decay, the fluorescence would be an altered wavelength, which in turn would be sensed and interpreted by the DiagnoDent to give out a numerical reading. With the DiagnoDent, we can now detect cavities smaller than the tip of a dental explorer.
